

Common-panel response to adjacent thresholds

Complete 175-cell census in both panels; different denominators are shown separately.
One post-inspection illustration is disclosed; no fitted line, ranking, or confirmatory comparison.

The fixed panel contains 376,890 candidates (364,814 resolved). Panel A uses cellwise resolved denominators (33,946-115,996); Panel B uses cellwise candidate denominators (35,138-119,786) and gives identification bounds, not uncertainty around Panel A. Sharpness is cellwise; endpoints need not be jointly attainable across contrasts.
