

Finite-archive coverage and joint-block rank-reference flags

A. Resolved coverage (open dots) and sharp completion bounds (segments)

B. Minimum miss-rate departure (percentage points)

Focused coverage scale. Bounds are sharp completion intervals, not sampling intervals.

Panel B pools integer strict-miss lower bounds before subtracting the weighted finite-sample reference rate.

Small F marks the 31/40 cells meeting the locked nominal Bonferroni-Holm thresholds; the post-inspection family has no selective-FWER claim.
